VECTOR INVERTER

INSTRUCTION MANUAL

FR-V5AH

16-BIT DIGITAL INPUT
Thank you for choosing the Mitsubishi vector inverter option unit. This instruction manual gives handling information and precautions for use of this equipment. Incorrect handling might cause an unexpected fault. Before using the equipment, please read this manual carefully to use the equipment to its optimum. Please forward this manual to the end user.

---

**This section is specifically about safety matters**

Do not attempt to install, operate, maintain or inspect this product until you have read through this instruction manual and appended documents carefully and can use the equipment correctly. Do not use this product until you have a full knowledge of the equipment, safety information and instructions. In this instruction manual, the safety instruction levels are classified into "WARNING" and "CAUTION".

- **WARNING**: Assumes that incorrect handling may cause hazardous conditions, resulting in death or severe injury.
- **CAUTION**: Assumes that incorrect handling may cause hazardous conditions, resulting in medium or slight injury, or may cause physical damage only.

Note that the CAUTION level may lead to serious consequences according to conditions. Please follow the instructions of both levels because they are important for personnel safety.

---

**SAFETY INSTRUCTIONS**

1. **Electric Shock Prevention**

<table>
<thead>
<tr>
<th><strong>WARNING</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>• While power is on or when the inverter is running, do not open the front cover. You may get an electric shock.</td>
</tr>
<tr>
<td>• Do not run the inverter with the front cover removed. Otherwise, you may access the exposed high-voltage terminals and charging part and get an electric shock.</td>
</tr>
<tr>
<td>• If power is off, do not remove the front cover except for wiring or periodic inspection. You may access the charged inverter circuits and get an electric shock.</td>
</tr>
<tr>
<td>• Before starting wiring or inspection, switch power off, wait for more than 10 minutes, and check for no residual voltage with a tester or the like.</td>
</tr>
</tbody>
</table>
2. Injury Prevention

Also note the following points to prevent an accidental failure, injury, electric shock, etc.:

1. Transportation and mounting

- Any person who is involved in the wiring or inspection of this equipment should be fully competent to do the work.
- Always install the option unit before wiring. Otherwise, you may get an electric shock or be injured.
- Handle this option unit with dry hands to prevent an electric shock.
- Do not subject the cables to scratches, excessive stress, heavy loads or pinching. Otherwise, you may get an electric shock.

2. Test operation and adjustment

- Any person who is involved in the wiring or inspection of this equipment should be fully competent to do the work.
- Always install the option unit before wiring. Otherwise, you may get an electric shock or be injured.
- Handle this option unit with dry hands to prevent an electric shock.
- Do not subject the cables to scratches, excessive stress, heavy loads or pinching. Otherwise, you may get an electric shock.

3. Additional instructions

Also note the following points to prevent an accidental failure, injury, electric shock, etc.:

1. Transportation and mounting

- Apply only the voltage specified in the instruction manual to each terminal to prevent burst, damage, etc.
- Ensure that the cables are connected to the correct terminals. Otherwise, burst, damage, etc. may occur.
- Always make sure that polarity is correct to prevent burst, damage, etc.
- While power is on or for some time after power-off, do not touch the inverter as it is hot and you may get burnt.

2. Test operation and adjustment

- Before starting operation, confirm and adjust the parameters. A failure to do so may cause some machines to make unexpected motions.
### Usage

<table>
<thead>
<tr>
<th>WARNING</th>
</tr>
</thead>
<tbody>
<tr>
<td>✖ Do not modify the equipment.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>✖ When parameter clear or all parameter clear is performed, each parameter returns to the factory setting. Re-set the required parameters before starting operation.</td>
</tr>
<tr>
<td>✖ For prevention of damage due to static electricity, touch nearby metal before touching this product to eliminate static electricity from your body.</td>
</tr>
</tbody>
</table>

### Maintenance, inspection and parts replacement

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>✖ Do not test the equipment with a megger (measure insulation resistance).</td>
</tr>
</tbody>
</table>

### Disposal

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>✖ Treat as industrial waste.</td>
</tr>
</tbody>
</table>

### General instruction

All illustrations given in this manual may have been drawn with covers or safety guards removed to provide in-depth description. Before starting operation of the product, always return the covers and guards into original positions as specified and operate the equipment in accordance with the manual.

1. PRE-OPERATION INSTRUCTIONS

1.1 Unpacking and Product Confirmation

Take the option unit out of the package, check the unit name, and confirm that the product is as you ordered and intact.

This product is an option unit designed for exclusive use in the Mitsubishi FR-V500 series vector inverter.

- SERIAL number check

  This product may be used with the FR-V500 series manufactured in and after March 2002. Any of the models may be used with this unit if its SERIAL number indicated on the rating plate and package has "O23000000" or later version. For details of the SERIAL number, please contact your sales representative.

  SERIAL is made up of 1 version symbol, 1 alphabet letter or numeric character indicating month, and 7 numeric characters indicating the year and control number as shown below. (Only the first three digits of the control number are printed on the package.)

  Symbol  Year  Month  Control number

  SERIAL number

1.2 Packing Confirmation

Make sure that the package includes the following:

- Instruction manual ................................................................. 1
- Mounting screws M3 x 10 ..................................................... 2
1.3 Structure

PRE-OPERATION INSTRUCTIONS
2. INSTALLATION

2.1 Pre-Installation Instructions
Make sure that the input power of the inverter is off.

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>⪗ With input power on, do not install or remove the option unit. Otherwise, the inverter and option unit may be damaged.</td>
</tr>
</tbody>
</table>

2.2 Installation Procedure
(1) Securely insert the connector of the option unit far into the connector of the inverter. At this time, fit the option fixing holes snugly. For the position of slot, refer to the next page. Also be sure to fit the unit into the option fixing hook.
(2) Securely fix the option unit to the inverter on both sides with the accessory mounting screws. If the screw holes do not match, the connector may not have been plugged snugly. Check for loose plugging.
**INSTALLATION**

**CAUTION**

1. Only one type of option per inverter may be used. When two or more options are mounted, priority is in order of slots 1, 2 and 3, the options having lower priority are inoperative.

2. When the inverter cannot recognize that the option is mounted, it displays the option error. The errors shown differ according to the mounting slots 1, 2, 3.

<table>
<thead>
<tr>
<th>Mounting Position</th>
<th>Error Display</th>

<tbody>
<tr>
<td>Slot 1</td>
<td>E.OP1</td>
</tr>
<tr>
<td>Slot 2</td>
<td>E.OP2</td>
</tr>
<tr>
<td>Slot 3</td>
<td>E.OP3</td>
</tr>
</tbody>
</table>

The slots 1, 2, and 3 are provided with an option fixing hook.
2.3 Wiring

Wiring method
1) For wiring the control circuit, use cables after stripping their sheaths.
Strip the sheaths to the following dimensions. If the sheath is stripped too much, its cable may be shorted with the adjoining cable. If the sheath is stripped too little, the cable may come off.

Cable stripping size

Wire the stripped cable after twisting it to prevent it from becoming loose.
In addition, do not solder it.*

"Information on bar terminals
Introduced products (as of Mar., 2002): Phoenix Contact Co., Ltd.

<table>
<thead>
<tr>
<th>Terminal Screw Size</th>
<th>Bar Terminal Model (With Insulation Sleeve)</th>
<th>Bar Terminal Model (Without Insulation Sleeve)</th>
<th>Wire Size (mm²)</th>
</tr>
</thead>
<tbody>
<tr>
<td>M2</td>
<td>A0.5-RWH</td>
<td>A 0.5-6</td>
<td>0.3 to 0.5</td>
</tr>
</tbody>
</table>

• Bar terminal crimping terminal: CRIMPFOX ZA3 (Phoenix Contact Co., Ltd.)

CAUTION

When using the bar terminal (without insulation sleeve), use care so that the twisted wires do not come out.
INSTALLATION

2) Loosen the terminal screw and insert the cable into the terminal.
   Screw size: M2
   Tightening torque: 0.22N·m to 0.25N·m

--- CAUTION ---
Underlightening can cause cable disconnection or malfunction. Overtightening can cause a short circuit or malfunction due to damage to the screw or unit.

Cable size: 0.3mm² to 0.75mm²
Screwdriver: Small flat-blade screwdriver
   (Tip thickness: 0.4mm (0.02inches)/tip width: 2.5mm (0.10inches))
ROUTE THE WIRES SO THAT THEY DO NOT TAKE UP A LOT OF SPACE IN THE CONTROL CIRCUIT TERMINAL BLOCK OF THE OPTION UNIT. DURING WIRING, DO NOT LEAVE WIRE OFF-CUTS IN THE INVERTER. THEY MAY CAUSE A FAULT, FAILURE OR MALFUNCTION. USE THE SPACE ON THE LEFT SIDE OF THE CONTROL CIRCUIT TERMINAL UNIT TO ROUTE THE WIRES.

REMARKS

The wires with large gaze may not be connected to the terminal block. When connected in parallel, all wires may not fit in the wiring space due to the increased number of wires. In such cases, perform wiring by using a junction terminal block.

CAUTION

When installing the inverter front cover, the cables to the inverter’s control circuit terminals and option terminals should be routed properly in the wiring space to prevent them from being caught between the inverter and its cover.
## 3.16-BIT DIGITAL INPUT

### 3.1 Wiring Examples

<table>
<thead>
<tr>
<th>Relay contact signal input</th>
<th>Open collector signal input</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="diagram1.png" alt="Relay contact signal input diagram" /></td>
<td><img src="diagram2.png" alt="Open collector signal input diagram" /></td>
</tr>
</tbody>
</table>

*1 Use the terminal PC on the inverter.

*2 AY41 type unit requires 24VDC power.

A wiring example of Mitsubishi PLC output module (AY41 type). For details of the output module, refer to the instruction manual of the output module.
REMARKS

1. As the input signals are at low level, use two parallel micro signal contacts or a twin contact for relay contact inputs to prevent a contact fault.

2. A transistor of the following specifications should be selected for the open collector signal: Electrical characteristics of the transistor used
   - $I_{CC} \geq 10mA$
   - Leakage current: $\leq 100\,\mu\text{A}$ maximum
   - $V_{CE} \geq 30V$
   - If $I_{CC} \geq 10mA$, $V_{CE}$ (sat) voltage is 3V maximum

3. The control logic is the same as that of the inverter (factory-set to sink). When the logic of the inverter is changed to source, the option logic also switches to source. For details on changing the control logic, refer to the inverter instruction manual (basic).
# 16-BIT DIGITAL INPUT

</tr>
</tbody>
</table>

### CAUTION

Range of each digit is from 0 to 9. If the value of a digit is greater than 9, the value is invalid and the previous value is kept.
4.1 Digital Speed Command Parameter

Use the following parameters to give a speed command using the FR-V5AH. The following parameters can be set when the FR-V5AH is fitted.

This option unit does not function if the parameter values are factory setting values. When Pr.304 ≠ "9999", a speed command by the 16-bit digital input is made valid.

Set the following parameter values according to the application:

<table>
<thead>
<tr>
<th>Parameter Number</th>
<th>Function name</th>
<th>Setting Range</th>
<th>Setting Increments</th>
<th>Factory Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>300</td>

<td>0 to 3600 r/min, 9999</td>
<td>0.1 r/min</td>
<td>0 r/min</td>
</tr>
<tr>
<td>303</td>
<td>Gain</td>
<td>0 to 3600 r/min, 9999</td>
<td>1 r/min</td>
<td>1500 r/min</td>
</tr>
<tr>
<td>304</td>
<td>Selection of digital input type and analog compensation input enable/disable</td>
<td>0, 1, 2, 3, 9999</td>
<td>1</td>
<td>9999</td>
</tr>
<tr>
<td>305</td>
<td>Data read timing signal on-off selection</td>
<td>0, 1</td>
<td>1</td>
<td>0</td>
</tr>
<tr>
<td>329</td>
<td>Digital input unit selection</td>
<td>0, 1, 2</td>
<td>1</td>
<td>1</td>
</tr>
</tbody>
</table>

**REMARKS**

- For Pr.329, write is disabled during operation even when "2" is set in Pr.77. When changing the parameter setting, stop the operation.
- Binary input... load input data in hexadecimal
- BCD code input... load input data in decimal
### 4.2 Parameter Setting

(1) **Input selection (Pr. 304 “selection of digital input type and analog compensation input enable / disable.”)**

You can select the digital input signal type and whether compensation for digital input by analog input is enabled or not. When the setting is “9999” (factory setting), the 16-bit digital input speed command is invalid.

<table>
<thead>
<tr>
<th>Digital Input Signal Type</th>
<th>Analog Compensation Input*</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Compensation disable</td>
</tr>
<tr>
<td>BCD code input</td>
<td>0</td>
</tr>
<tr>
<td>Binary input</td>
<td>1</td>
</tr>
</tbody>
</table>

* The analog compensation input signal is entered across inverter 1-5. For the setting of “0” or “1”, the analog compensation input is not accepted.
### DIGITAL SPEED COMMAND

(2) Data read timing signal on-off selection (Pr.305)

<table>
<thead>
<tr>
<th>Pr.305 setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>The set speed data entered from the digital signal input terminals is always imported independently of whether the DY signal is on or off.</td>
</tr>
<tr>
<td>1</td>
<td>The set speed data entered from the digital signal input terminals is imported only when the DY signal is on. The set speed data is not imported when the DY signal is off. Therefore, if the input status of the X0-X15 signal changes, the set speed data before off of the DY signal is valid.</td>
</tr>
</tbody>
</table>

#### How to use DY signal

- Digital signal input (terminals X0 to X15)
- Data read timing signal (across terminals DY-SD)

#### Remarks

When Pr. 305 = "1", all the X0 to X15 terminals are regarded as off if the inverter is switched on with the DY terminal off. For example, when bias is set to 500r/min, powering on the inverter with the DY signal off and turning the start signal on makes the speed command valid, starting the inverter to operate at 500r/min.
(3) Bias adjustment (Pr.300), (Pr.302)
Bias adjustments can be made for the digital input signal.
Set the set speed at the digital input of 0.
  • BCD code input . . . . . . . . Set the output speed in Pr.300.
  • Binary input . . . . . . . . . . . Set the output speed in Pr.302.
(4) Gain adjustment (Pr.301), (Pr.303)
The gain may be set in either of the following two ways:
  • How to set the output speed at the input signal of 9999 (BCD code) or FFFFh (binary)
  • BCD code input . . . . . . . . Set the output speed in Pr.301.
  • Binary input . . . . . . . . . . . Set the output speed in Pr.303.
The factory setting is 1500r/min. for this input signal.

--- CAUTION ---
The maximum operation speed for operation with the digital input is the "gain" value set in Pr.301 and Pr.303.
To set the maximum operation speed to 1500r/min or more, change the "gain" from the control panel or parameter unit.
**DIGITAL SPEED COMMAND**

- How to set the BCD code or binary value as the output speed setting
  
  When "9999" is set in Pr.301 (BCD code) or Pr.303 (binary), the digital input value is set (unchanged) as output speed.
  
  (For example, to set the output speed to 1500r/min at the BCD code input of "1500")

  ![Graph showing digital input signal value and output speed relationship]

  **REMARKS**
  
  When this setting method is used, "bias" setting (Pr.300 or Pr.302) cannot be made.

(5) Digital input unit selection (Pr.329)

When "9999" is set in Pr.301 (BCD code input gain) or Pr.303 (binary input gain), the increment when the digital signal is set as output speed can be set.

\[
\text{speed command value} = \text{digital input signal value} \times \text{Pr. 329 input increment}
\]

<table>
<thead>
<tr>
<th>Pr.329 setting</th>
<th>Input Value Increments</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>0.1r/min</td>
</tr>
<tr>
<td>1 (factory setting)</td>
<td>1r/min</td>
</tr>
</tbody>
</table>

*The setting "2" is for the 12-bit digital input option unit FR-A5AX. The input increment is 1r/min.*

**Example**

Pr.329=0

- BCD code = 111  \(\rightarrow 11.1\text{r/min}\)
- Binary = 100H (256 in decimal)  \(\rightarrow 25.6\text{r/min}\)

Pr.329=1

- BCD code = 111  \(\rightarrow 111\text{r/min}\)
- Binary = 100H (256 in decimal)  \(\rightarrow 256\text{r/min}\)

**REMARKS**

When the values other than "9999" are set in Pr.301 or Pr.303, Pr.329 is made invalid.
4.3 Instructions

(1) Acceleration/deceleration time
   When the speed is set with the digital input signal, the acceleration/deceleration time is the period of
   time required to reach the Pr. 20. This is the same as when using the analog signal input.

(2) There are the following restrictions on the digital input signal:
   When the signal is used to enter a BCD code, 0AH to 0FH entries are ignored during operation and the
   previous inputs are used to continue operation.

(3) When the 16-bit digital input is valid (Pr. 304 setting is other than "9999"), the signals below are made
   invalid.
   Terminal assignment of input signal is determined according to input terminal function selection (Pr.180 to
   Pr.183 and Pr.187).

(4) When the FR-V5AH and 12-bit digital input option unit FR-A5AX are used at the same time, the digital
    input of the FR-V5AH overrides the FR-A5AX.

(5) If 0 to ±10V is entered into terminal 1 of the inverter from the external volume with the option (FR-V5AH)
    mounted on the inverter, operation is performed at the speed, which is the sum of the BCD code input
    of the FR-V5AH and the auxiliary input from terminal 1, only when 2 or 3 is set in Pr. 304.
    When switching the inputs e.g. between volume input to perform manual operation and BCD code input
    to perform automatic operation, set the BCD code input to "0" under manual operation.

[| Signal Name | Description          |
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>RL</td>
<td>Low speed operation command</td>
</tr>
<tr>

</tr>
<tr>
<td>RH</td>
<td>High speed operation command</td>
</tr>
<tr>
<td>REX</td>
<td>15-speed setting (combination with RL, RM, RH)</td>
</tr>
</tbody>
</table>

[REMARKS]
When performing an auxiliary input using terminal 1 with the FR-V500 series, set "0" (factory setting) in Pr.868 "Ter-
   minal 1 function assignment".
5. DIGITAL TORQUE COMMAND

5.1 Digital Torque Command Parameters

Use the following parameters to give the torque command using the FR-V5AH. The following parameters can be set when the FR-V5AH is mounted.

Set the parameter values according to the application:

<table>
<thead>
<tr>
<th>Parameter Number</th>
<th>Function name</th>
<th>Setting Range</th>
<th>Setting Increments</th>
<th>Factory Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>304</td>
<td>Selection of digital input type and analog compensation input enable/disable</td>
<td>0, 1, 2, 3, 9999</td>
<td>1</td>
<td>9999</td>
</tr>
<tr>
<td>447</td>
<td>Digital torque command bias</td>
<td>0 to 400%</td>
<td>1%</td>
<td>0%</td>
</tr>
<tr>
<td>448</td>
<td>Digital torque command gain</td>
<td>0 to 400%</td>

<td>150%</td>
</tr>
<tr>
<td>804</td>
<td>Torque command right selection</td>
<td>0 to 4</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

5.2 Parameter Setting

When "9999" (factory setting) is set in Pr.304 and "4" in Pr.804 "torque command selection" (The parameter setting can be made only when the FR-V5AH is mounted on the inverter.), digital torque command of the FR-V5AH (16 bit) is made valid.

The input signal uses the last 15 bits as torque command and the most significant bit as sign. (When the most significant bit is "1", torque command value is negative.)

![Diagram showing bit allocation and sign bit.]
(1) Bias adjustment (Pr. 447)
Bias adjustments can be made for the digital input signal.
Set the torque command value at the digital input of 0.

(2) Gain adjustment (Pr. 448)
The gain may be set in either of the following two ways:
• How to set the output torque command value at the input signal of FFFFH

Torque command value

Factory setting

Digital input signal

Most significant bit = 1

Most significant bit = 0
DIGITAL TORQUE COMMAND

- How to set the digital input value as the torque command value
  When "9999" is set in Pr. 448, the digital input value is set (unchanged) as the torque command value.

**REMARKS**
When the method to set the digital input value as the torque command value is used, "bias" setting (Pr. 447) cannot be made.

5.3 Instructions
When the FR-V5AH and 12-bit digital input option unit FR-A5AX are used at the same time, the digital input of the FR-V5AH overrides the FR-A5AX.
6. ORIENTATION POSITION COMMAND

6.1 Orientation Position Command Parameter

The orientation stop position by the 16-bit data input can be given using the FR-V5AH. Refer to the inverter manual for details of orientation control.

<table>
<thead>
<tr>
<th>Parameter Number</th>
<th>Function Name</th>
<th>Setting Range</th>
<th>Factory Setting</th>
<th>Setting Increments</th>
</tr>
</thead>
<tbody>
<tr>
<td>350</td>
<td>Stop position command selection</td>
<td>0, 1, 2, 3, 9999</td>
<td>9999</td>
<td>1</td>
</tr>
<tr>
<td>360</td>
<td>External position command selection</td>
<td>0, 1, 2 to 127</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>

6.2 Parameter Setting

(1) Selecting stop position command (Pr. 350 "stop position command selection")

Set Pr. 350 to "3" to give the orientation stop position command using the FR-V5AH.

(2) Setting stop position (Pr. 360 "external position command selection")

Mount the FR-V5AH and set a stop position using 16-bit data (binary input).

- The value set in Pr. 360 "external position command selection" should be the number of stop positions less 1.

<table>
<thead>
<tr>
<th>Pr. 360 Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>External position command is made invalid (speed command or torque command with the FR-V5AH)</td>
</tr>
<tr>
<td>1</td>
<td>Set 65536 stop positions at regular intervals</td>
</tr>
</tbody>
</table>
| 2 to 127        | Set the stop position command dividing up to 128 stop positions at regular intervals.

If the external stop command entered is greater than the setting, the stop positions are the same as those in the maximum external stop command value.

Example:

When the number of stop positions is 90 (divided at intervals of 4°), 90 - 1 = 89. Hence, set "89".
• Values in parentheses indicate binary data entered from the input terminals. If the position pulse monitoring (Pr. 52 “DU/PU main display screen data selection” = 19) is selected, the data monitored is not the number of stop positions but is 0 to 65535 pulses.

• When any of “1 to 127” is set in Pr. 360, parameters (Pr. 300 to Pr. 305) of the FR-V5AH are made invalid. (Parameters are valid when Pr. 360 = “0”.)

• Terminal DY (Data read timing input signal) is made invalid. (The position data is downloaded at the start of orientation.)

• When the option is not fitted or Pr. 360 = “0”, the stop position is 0 even if the external stop position command is selected with the Pr. 350 setting.
7. SPECIFICATIONS

7.1 Specifications

- Digital input signal type: 4-digit BCD code or 16-bit binary
- Digital input signal selection: From operation panel or parameter unit
- Input current: 5mA (24VDC) per circuit
- Input: Contact signal or open collector input
- Adjustment functions:
  1. Bias and gain
  2. Analog compensation input
     (Use control panel or parameter unit for setting.)
