1. PRE-OPERATION INSTRUCTIONS

1.1 Unpacking and Product Confirmation
Take the option unit out of the package, check the unit name, and confirm that the product is as you ordered and intact.
This product is an option unit designed for exclusive use in the Mitsubishi FR-V500 series vector inverter. Functions available differ, before using it, always make the following checks.

1.2 Packing Confirmation
Make sure that the package includes the following
- Instruction manual ......................................................... 1
- Mounting screws M3 x 10 .................................................. 2

1.3 Structure

2. INSTALLATION

2.1 Pre-Installation Instructions

Make sure that the input power of the inverter is off.

<table>
<thead>
<tr>
<th>CAUTION</th>
</tr>
</thead>
<tbody>
<tr>
<td>With input power on, do not install or remove the option unit. Otherwise, the inverter and option unit may be damaged.</td>
</tr>
</tbody>
</table>

2.2 Installation Procedure

(1) Securely insert the connector of the option unit far into the connector of the inverter. At this time, fit the option fixing holes snugly.
Also be sure to fit the unit into the option fixing hook.
(2) Securely fix the option unit to the inverter on both sides with the accessory mounting screws. If the screw holes do not match, the connector may not have been plugged snugly. Check for loose plugging.
CAUTION

1. Only one type of option per inverter may be used. When two or more options are mounted, priority is in order of slots 1, 2 and 3, the options having lower priority are inoperative.

2. When the inverter cannot recognize that the option is mounted, it displays the option error. The errors shown differ according to the mounting slots 1, 2, 3.

The slots 1, 2, and 3 are provided with an option fixing hook.
2.3 Wiring

Route the wires so that they do not take up a large space in the control circuit terminal block of the option unit. During wiring, do not leave wire off-cuts in the inverter. They may cause a fault, failure or malfunction. Use the space on the left side of the Control circuit terminal unit to route the wires.

**REMARKS**

The wires with large gage may not be connected to the terminal block. When connected in parallel, all wires may not fit in the wiring space due to the increased number of wires. In such cases, perform wiring by using a junction terminal block.

**CAUTION**

When installing the inverter front cover, the cables to the inverter’s control circuit terminals and option terminals should be routed properly in the wiring space to prevent them from being caught between the inverter and its cover.
3. ADDITIONAL OPEN COLLECTOR OUTPUT

3.1 Overview
Three terminal output points can be added by making the assignment of the output terminals using Pr. 410 to Pr. 412 (output terminal function selection). At this time, since four more points can be chosen with Pr. 190 to Pr. 192 and Pr. 195 (output terminal function selection) of the inverter, a total of seven output terminals are available.

</tbody>

**REMARKS**

For Pr.410 to Pr.412, write is disabled during operation even when “2” is set in Pr.77. When changing the parameter setting, stop the operation.

### 3.4 Setting

The functions of the DO11, DO12 and DO13 output terminals can be assigned individually. The settings of Pr. 410 to Pr. 412 (output terminal function selection) are the same as those of Pr. 190 to Pr. 192 and Pr. 195 (output terminal function selection). For details of Pr. 190 to Pr. 192 and Pr. 195, refer to the Inverter Instruction Manual (basic).
4. PLG PULSE DIVISION OUTPUT

The PLG pulse input connected to the inverter can be divided and output from the terminals of the option.

4.1 Block Diagram
PLG PULSE DIVISION OUTPUT

**CAUTION**

For open collector output, the signal becomes unstable when the input resistance of the connected device is high, resulting in miss detection of the signal. This may be improved by connecting the pull-up resistance.

Select the resistance value of the pull-up resistance considering the input current of the connected device so that the open collector output current does not exceed the permissible output load current.
4.2 Explanation of the Terminals

Output the A-phase, B-phase and Z-phase (origin and mark pulse) signals from the PLG. The A-phase and B-phase signals can be divided by the ratio \((1/n)\) and output. \(n = 1\) to 32767 (integer). Set the ratio in Pr. 413 "PLG pulse division ratio".

This PLG pulse division output function uses the following terminals.

- **Open collector**
  - FPA2: A-phase output terminal
  - FPB2: B-phase output terminal
  - FPZ2: Z-phase output terminal

- **Differential line driver**
  - FPA: Differential A-phase output terminal
  - FPB: Differential B-phase output terminal
  - FPZ: Differential Z-phase output terminal
  - FPA2: Differential A-phase inverse signal output terminal
  - FPB2: Differential B-phase inverse signal output terminal
  - FPZ2: Differential Z-phase inverse signal output terminal

The division ratio setting is same for open collector output and differential line driver output.

1. Pr. 413 "PLG pulse output division ratio"  
   The signals of motor end PLG pulses can be divided and output at the division ratio set in Pr. 413. Used to lower the response level of the machine to which pulses are input, for example.

2. Division waveforms according to the division ratio  
   Both the ON and OFF widths are multiplied by the set value. (50% duty)
   - Pulse waveform when Pr. 413 = 2 (ON/OFF example at input of 1000 pulses)

![Diagram of division waveforms]

**REMARKS**

Forward/reverse rotation control is exercised according to the phase difference between the A and B phases.

- When the A phase leads the B phase by 90°: Forward rotation
- When the A phase lags the B phase by 90°: Reverse rotation
