SAFETY PRECAUTIONS

(Read these precautions before using this product.)

Before using this product, please read this manual and the relevant manuals carefully and pay full attention to safety to handle the product correctly.

The precautions given in this manual are concerned with this product only. For the safety precautions of the programmable controller system, refer to the MELSEC iQ-R Module Configuration Manual.

In this manual, the safety precautions are classified into two levels: "⚠️ WARNING" and "⚠️ CAUTION".

| ⚠️ WARNING | Indicates that incorrect handling may cause hazardous conditions, resulting in death or severe injury. |
| ⚠️ CAUTION | Indicates that incorrect handling may cause hazardous conditions, resulting in minor or moderate injury or property damage. |

Under some circumstances, failure to observe the precautions given under "⚠️ CAUTION" may lead to serious consequences.

Observe the precautions of both levels because they are important for personal and system safety.
Make sure that the end users read this manual and then keep the manual in a safe place for future reference.
[Design Precautions]

⚠️ WARNING

● Configure safety circuits external to the programmable controller to ensure that the entire system operates safely even when a fault occurs in the external power supply or the programmable controller. Failure to do so may result in an accident due to an incorrect output or malfunction.

1. (1) Emergency stop circuits, protection circuits, and protective interlock circuits for conflicting operations (such as forward/reverse rotations or upper/lower limit positioning) must be configured external to the programmable controller.

(2) When the programmable controller detects an abnormal condition, it stops the operation and all outputs are:
   - Turned off if the overcurrent or overvoltage protection of the power supply module is activated.
   - Held or turned off according to the parameter setting if the self-diagnostic function of the CPU module detects an error such as a watchdog timer error.

(3) All outputs may be turned on if an error occurs in a part, such as an I/O control part, where the CPU module cannot detect any error. To ensure safety operation in such a case, provide a safety mechanism or a fail-safe circuit external to the programmable controller. For a fail-safe circuit example, refer to "General Safety Requirements" in the MELSEC iQ-R Module Configuration Manual.

(4) Outputs may remain on or off due to a failure of a component such as a relay and transistor in an output circuit. Configure an external circuit for monitoring output signals that could cause a serious accident.

● In an output circuit, when a load current exceeding the rated current or an overcurrent caused by a load short-circuit flows for a long time, it may cause smoke and fire. To prevent this, configure an external safety circuit, such as a fuse.

● For the operating status of each station after a communication failure, refer to manuals relevant to the network. Incorrect output or malfunction due to a communication failure may result in an accident.

● When connecting an external device with a CPU module or intelligent function module to modify data of a running programmable controller, configure an interlock circuit in the program to ensure that the entire system will always operate safely. For other forms of control (such as program modification, parameter change, forced output, or operating status change) of a running programmable controller, read the relevant manuals carefully and ensure that the operation is safe before proceeding. Improper operation may damage machines or cause accidents.
[Design Precautions]

⚠️ WARNING ⚠️

● Especially, when a remote programmable controller is controlled by an external device, immediate action cannot be taken if a problem occurs in the programmable controller due to a communication failure. To prevent this, configure an interlock circuit in the program, and determine corrective actions to be taken between the external device and CPU module in case of a communication failure.

● Do not write any data to the "system area" and "write-protect area" of the buffer memory in the module. Also, do not use any "use prohibited" signals as an output signal from the CPU module to each module. Doing so may cause malfunction of the programmable controller system. For the "system area", "write-protect area", and the "use prohibited" signals, refer to the user's manual for the module used.

● If a communication cable is disconnected, the network may be unstable, resulting in a communication failure of multiple stations. Configure an interlock circuit in the program to ensure that the entire system will always operate safely even if communications fail. Failure to do so may result in an accident due to an incorrect output or malfunction.

● To maintain the safety of the programmable controller system against unauthorized access from external devices via the network, take appropriate measures. To maintain the safety against unauthorized access via the Internet, take measures such as installing a firewall.

● An AnyWireASLINK system has no control function for ensuring safety.

[Design Precautions]

⚠️ CAUTION ⚠️

● Do not install the control lines or communication cables together with the main circuit lines or power cables. Keep a distance of 100mm or more between them. Failure to do so may result in malfunction due to noise.

● During control of an inductive load such as a lamp, heater, or solenoid valve, a large current (approximately ten times greater than normal) may flow when the output is turned from off to on. Therefore, use a module that has a sufficient current rating.

● After the CPU module is powered on or is reset, the time taken to enter the RUN status varies depending on the system configuration, parameter settings, and/or program size. Design circuits so that the entire system will always operate safely, regardless of the time.

● Do not power off the programmable controller or reset the CPU module while the settings are being written. Doing so will make the data in the flash ROM and SD memory card undefined. The values need to be set in the buffer memory and written to the flash ROM and SD memory card again. Doing so also may cause malfunction or failure of the module.

● When changing the operating status of the CPU module from external devices (such as the remote RUN/STOP functions), select "Do Not OPEN in Program" for "Open Method Setting" of "Module Parameter". If "OPEN in Program" is selected, an execution of the remote STOP function causes the communication line to close. Consequently, the CPU module cannot reopen the line, and external devices cannot execute the remote RUN function.
[Installation Precautions]

⚠️ **WARNING**

- Shut off the external power supply (all phases) used in the system before mounting or removing the module. Failure to do so may result in electric shock or cause the module to fail or malfunction.

[Installation Precautions]

⚠️ **CAUTION**

- Use the programmable controller in an environment that meets the general specifications in the Safety Guidelines included with the base unit. Failure to do so may result in electric shock, fire, malfunction, or damage to or deterioration of the product.
- To mount a module, place the concave part(s) located at the bottom onto the guide(s) of the base unit, and push in the module until the hook(s) located at the top snaps into place. Incorrect interconnection may cause malfunction, failure, or drop of the module.
- To mount a module with no module fixing hook, place the concave part(s) located at the bottom onto the guide(s) of the base unit, push in the module, and fix it with screw(s). Incorrect interconnection may cause malfunction, failure, or drop of the module.
- When using the programmable controller in an environment of frequent vibrations, fix the module with a screw.
- Tighten the screws within the specified torque range. Undertightening can cause drop of the screw, short circuit, or malfunction. Overtightening can damage the screw and/or module, resulting in drop, short circuit, or malfunction.
- When using an extension cable, connect it to the extension cable connector of the base unit securely. Check the connection for looseness. Poor contact may cause malfunction.
- When using an SD memory card, fully insert it into the SD memory card slot. Check that it is inserted completely. Poor contact may cause malfunction.
- Securely insert an extended SRAM cassette or a battery-less option cassette into the cassette connector of the CPU module. After insertion, close the cassette cover and check that the cassette is inserted completely. Poor contact may cause malfunction.
- Do not directly touch any conductive parts and electronic components of the module, SD memory card, extended SRAM cassette, battery-less option cassette, or connector. Doing so can cause malfunction or failure of the module.
[Wiring Precautions]

⚠️ WARNING

● Shut off the external power supply (all phases) used in the system before installation and wiring. Failure to do so may result in electric shock or cause the module to fail or malfunction.
● After installation and wiring, attach a blank cover module (RG60) to each empty slot and an included extension connector protective cover to the unused extension cable connector before powering on the system for operation. Failure to do so may result in electric shock.

⚠️ CAUTION

● Individually ground the FG and LG terminals of the programmable controller with a ground resistance of 100 ohms or less. Failure to do so may result in electric shock or malfunction.
● Use applicable solderless terminals and tighten them within the specified torque range. If any spade solderless terminal is used, it may be disconnected when the terminal screw comes loose, resulting in failure.
● Check the rated voltage and signal layout before wiring to the module, and connect the cables correctly. Connecting a power supply with a different voltage rating or incorrect wiring may cause fire or failure.
● Connectors for external devices must be crimped or pressed with the tool specified by the manufacturer, or must be correctly soldered. Incomplete connections may cause short circuit, fire, or malfunction.
● Securely connect the connector to the module. Poor contact may cause malfunction.
● Do not install the control lines or communication cables together with the main circuit lines or power cables. Keep a distance of 100mm or more between them. Failure to do so may result in malfunction due to noise.
● Place the cables in a duct or clamp them. If not, dangling cable may swing or inadvertently be pulled, resulting in damage to the module or cables or malfunction due to poor contact. Do not clamp the extension cables with the jacket stripped. Doing so may change the characteristics of the cables, resulting in malfunction.
● Check the interface type and correctly connect the cable. Incorrect wiring (connecting the cable to an incorrect interface) may cause failure of the module and external device.
● Tighten the terminal screws or connector screws within the specified torque range. Undertightening can cause drop of the screw, short circuit, fire, or malfunction. Overtightening can damage the screw and/or module, resulting in drop, short circuit, fire, or malfunction.
● When disconnecting the cable from the module, do not pull the cable by the cable part. For the cable with connector, hold the connector part of the cable. For the cable connected to the terminal block, loosen the terminal screw. Pulling the cable connected to the module may result in malfunction or damage to the module or cable.
[Wiring Precautions]

⚠️ CAUTION ⚠️

● Prevent foreign matter such as dust or wire chips from entering the module. Such foreign matter can cause a fire, failure, or malfunction.
● A protective film is attached to the top of the module to prevent foreign matter, such as wire chips, from entering the module during wiring. Do not remove the film during wiring. Remove it for heat dissipation before system operation.
● Programmable controllers must be installed in control panels. Connect the main power supply to the power supply module in the control panel through a relay terminal block. Wiring and replacement of a power supply module must be performed by qualified maintenance personnel with knowledge of protection against electric shock. For wiring, refer to the MELSEC iQ-R Module Configuration Manual.
● For Ethernet cables to be used in the system, select the ones that meet the specifications in the user's manual for the module used. If not, normal data transmission is not guaranteed.
● Do not apply the 24VDC power before wiring the entire AnyWireASLINK system. If the power is applied before wiring, normal data transmission is not guaranteed.
● Connect a 24VDC external power supply to the device(s) in an AnyWireASLINK system.

[Startup and Maintenance Precautions]

⚠️ WARNING ⚠️

● Do not touch any terminal while power is on. Doing so will cause electric shock or malfunction.
● Correctly connect the battery connector. Do not charge, disassemble, heat, short-circuit, solder, or throw the battery into the fire. Also, do not expose it to liquid or strong shock. Doing so will cause the battery to produce heat, explode, ignite, or leak, resulting in injury and fire.
● Shut off the external power supply (all phases) used in the system before cleaning the module or retightening the terminal screws, connector screws, or module fixing screws. Failure to do so may result in electric shock.
[Startup and Maintenance Precautions]

⚠ CAUTION

- When connecting an external device with a CPU module or intelligent function module to modify data of a running programmable controller, configure an interlock circuit in the program to ensure that the entire system will always operate safely. For other forms of control (such as program modification, parameter change, forced output, or operating status change) of a running programmable controller, read the relevant manuals carefully and ensure that the operation is safe before proceeding. Improper operation may damage machines or cause accidents.

- Especially, when a remote programmable controller is controlled by an external device, immediate action cannot be taken if a problem occurs in the programmable controller due to a communication failure. To prevent this, configure an interlock circuit in the program, and determine corrective actions to be taken between the external device and CPU module in case of a communication failure.

- Do not disassemble or modify the modules. Doing so may cause failure, malfunction, injury, or a fire.

- Use any radio communication device such as a cellular phone or PHS (Personal Handy-phone System) more than 25cm away in all directions from the programmable controller. Failure to do so may cause malfunction.

- Shut off the external power supply (all phases) used in the system before mounting or removing the module. Failure to do so may cause the module to fail or malfunction.

- Tighten the screws within the specified torque range. Undertightening can cause drop of the component or wire, short circuit, or malfunction. Overtightening can damage the screw and/or module, resulting in drop, short circuit, or malfunction.

- After the first use of the product, do not perform each of the following operations more than 50 times (IEC 61131-2/JIS B 3502 compliant). Exceeding the limit may cause malfunction.
  - Mounting/removing the module to/from the base unit
  - Inserting/removing the extended SRAM cassette or battery-less option cassette to/from the CPU module
  - Mounting/removing the terminal block to/from the module

- After the first use of the product, do not insert/remove the SD memory card to/from the CPU module more than 500 times. Exceeding the limit may cause malfunction.

- Do not touch the metal terminals on the back side of the SD memory card. Doing so may cause malfunction or failure of the module.

- Do not touch the integrated circuits on the circuit board of an extended SRAM cassette or a battery-less option cassette. Doing so may cause malfunction or failure of the module.

- Do not drop or apply shock to the battery to be installed in the module. Doing so may damage the battery, causing the battery fluid to leak inside the battery. If the battery is dropped or any shock is applied to it, dispose of it without using.

- Startup and maintenance of a control panel must be performed by qualified maintenance personnel with knowledge of protection against electric shock. Lock the control panel so that only qualified maintenance personnel can operate it.

- Before handling the module, touch a conducting object such as a grounded metal to discharge the static electricity from the human body. Failure to do so may cause the module to fail or malfunction.
[Operating Precautions]

⚠️ CAUTION

- When changing data and operating status, and modifying program of the running programmable controller from an external device such as a personal computer connected to an intelligent function module, read relevant manuals carefully and ensure the safety before operation. Incorrect change or modification may cause system malfunction, damage to the machines, or accidents.
- Do not power off the programmable controller or reset the CPU module while the setting values in the buffer memory are being written to the flash ROM in the module. Doing so will make the data in the flash ROM and SD memory card undefined. The values need to be set in the buffer memory and written to the flash ROM and SD memory card again. Doing so can cause malfunction or failure of the module.

[Disposal Precautions]

⚠️ CAUTION

- When disposing of this product, treat it as industrial waste.
- When disposing of batteries, separate them from other wastes according to the local regulations. For details on battery regulations in EU member states, refer to the MELSEC iQ-R Module Configuration Manual.

[Transportation Precautions]

⚠️ CAUTION

- When transporting lithium batteries, follow the transportation regulations. For details on the regulated models, refer to the MELSEC iQ-R Module Configuration Manual.
- The halogens (such as fluorine, chlorine, bromine, and iodine), which are contained in a fumigant used for disinfection and pest control of wood packaging materials, may cause failure of the product. Prevent the entry of fumigant residues into the product or consider other methods (such as heat treatment) instead of fumigation. The disinfection and pest control measures must be applied to unprocessed raw wood.
CONDITIONS OF USE FOR THE PRODUCT

(1) Mitsubishi programmable controller ("the PRODUCT") shall be used in conditions;
   i) where any problem, fault or failure occurring in the PRODUCT, if any, shall not lead to any major or serious accident;
   and
   ii) where the backup and fail-safe function are systematically or automatically provided outside of the PRODUCT for the case of any problem, fault or failure occurring in the PRODUCT.

(2) The PRODUCT has been designed and manufactured for the purpose of being used in general industries.

MITUBISHI SHALL HAVE NO RESPONSIBILITY OR LIABILITY (INCLUDING, BUT NOT LIMITED TO ANY AND ALL RESPONSIBILITY OR LIABILITY BASED ON CONTRACT, WARRANTY, TORT, PRODUCT LIABILITY) FOR ANY INJURY OR DEATH TO PERSONS OR LOSS OR DAMAGE TO PROPERTY CAUSED BY the PRODUCT THAT ARE OPERATED OR USED IN APPLICATION NOT INTENDED OR EXCLUDED BY INSTRUCTIONS, PRECAUTIONS, OR WARNING CONTAINED IN MITSUBISHI'S USER, INSTRUCTION AND/OR SAFETY MANUALS, TECHNICAL BULLETINS AND GUIDELINES FOR the PRODUCT.

("Prohibited Application")

Prohibited Applications include, but not limited to, the use of the PRODUCT in:

• Nuclear Power Plants and any other power plants operated by Power companies, and/or any other cases in which the public could be affected if any problem or fault occurs in the PRODUCT.

• Railway companies or Public service purposes, and/or any other cases in which establishment of a special quality assurance system is required by the Purchaser or End User.

• Aircraft or Aerospace, Medical applications, Train equipment, transport equipment such as Elevator and Escalator, Incineration and Fuel devices, Vehicles, Manned transportation, Equipment for Recreation and Amusement, and Safety devices, handling of Nuclear or Hazardous Materials or Chemicals, Mining and Drilling, and/or other applications where there is a significant risk of injury to the public or property.

Notwithstanding the above restrictions, Mitsubishi may in its sole discretion, authorize use of the PRODUCT in one or more of the Prohibited Applications, provided that the usage of the PRODUCT is limited only for the specific applications agreed to by Mitsubishi and provided further that no special quality assurance or fail-safe, redundant or other safety features which exceed the general specifications of the PRODUCTs are required. For details, please contact the Mitsubishi representative in your region.

INTRODUCTION

Thank you for purchasing the Mitsubishi Electric MELSEC iQ-R series programmable controllers.

This manual describes the procedures, system configuration, and wiring of the relevant product listed below.

Before using this product, please read this manual and the relevant manuals carefully and develop familiarity with the functions and performance of the MELSEC iQ-R series programmable controller to handle the product correctly.

When applying the program examples provided in this manual to an actual system, ensure the applicability and confirm that it will not cause system control problems.

Please make sure that the end users read this manual.

This module was jointly developed by Mitsubishi and Anywire Corporation. The module allows the AnyWireASLINK® system to be connected to a MELSEC iQ-R series programmable controller system.

Relevant product

RJ51AW12AL
COMPLIANCE WITH EMC AND LOW VOLTAGE DIRECTIVES

Method of ensuring compliance
To ensure that Mitsubishi programmable controllers maintain EMC and Low Voltage Directives when incorporated into other machinery or equipment, certain measures may be necessary. Please refer to one of the following manuals.

- MELSEC iQ-R Module Configuration Manual
- Safety Guidelines (This manual is included with the base unit.)

The CE mark on the side of the programmable controller indicates compliance with EMC and Low Voltage Directives.

Additional measures
To ensure that this product maintains EMC and Low Voltage Directives, please refer to one of the following manuals.

- MELSEC iQ-R Module Configuration Manual
- Safety Guidelines (This manual is included with the base unit.)

</thead>
<tbody>
<tr>
<td>MELSEC iQ-R AnyWireASLINK Master Module User's Manual (Startup) [SH-081584ENG] (this manual)</td>
<td>Specifications, procedures before operation, system configuration, wiring, and communication examples of the AnyWireASLINK master module</td>
<td>Print book, e-Manual PDF</td>
</tr>
</tbody>
</table>

This manual does not include detailed information on the following:
• General Specifications
• Applicable combinations of CPU modules and the other modules, and the number of mountable modules
• Installation
For details, refer to the following.
MELSEC iQ-R Module Configuration Manual

![Point](e-Manual refers to the Mitsubishi FA electronic book manuals that can be browsed using a dedicated tool.

e-Manual has the following features:
• Required information can be cross-searched in multiple manuals.
• Other manuals can be accessed from the links in the manual.
• The hardware specifications of each part can be found from the product figures.
• Sample programs can be copied to an engineering tool.)
Unless otherwise specified, this manual uses the following terms.

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address</td>
<td>A setting value assigned to a slave module to identify each node on the AnyWireASLINK network</td>
</tr>
<tr>
<td>Address writer</td>
<td>A hand-held device to read/write device parameters (including addresses) from/to a slave module</td>
</tr>
<tr>
<td>AnyWireASLINK</td>
<td>A reduced wiring network where sensors at the end of a control system are connected to a programmable controller. This network enables a master module to detect sensor disconnection and enables a user to set the I/O operations of an AnyWireASLINK system on the RJ51AW12AL from the upper system without using the I/O areas of the CPU module.</td>
</tr>
<tr>
<td>Buffer memory</td>
<td>Memory in an intelligent function module for storing data such as setting values and monitored values.</td>
</tr>
<tr>
<td>Device</td>
<td>A device (X, Y, M, D, or others) in a CPU module</td>
</tr>
<tr>
<td>Engineering tool</td>
<td>Another term for the software package for the MELSEC programmable controllers</td>
</tr>
<tr>
<td>ID</td>
<td>A parameter to identify whether the module is an input module or output module based on its address</td>
</tr>
<tr>
<td>Intelligent function module</td>
<td>A module that has functions other than input and output, such as an A/D converter module and D/A converter module</td>
</tr>
<tr>
<td>Label</td>
<td>A label that represents a device in a given character string</td>
</tr>
<tr>
<td>Module label</td>
<td>A label that represents one of memory areas (I/O signals and buffer memory areas) specific to each module in a given character string. For the module used, GX Works3 automatically generates this label, which can be used as a global label.</td>
</tr>
<tr>
<td>Power cable (24V, 0V)</td>
<td>A cable that connects a 24VDC external power supply to the RJ51AW12AL. This cable is also used when the isolation (4-line) type slave module and RJ51AW12AL are connected.</td>
</tr>
<tr>
<td>RAS</td>
<td>An abbreviation for Reliability, Availability, and Serviceability. This term refers to usability of automated equipment.</td>
</tr>
<tr>
<td>Terminating unit</td>
<td>A waveform shaper</td>
</tr>
<tr>
<td>Transmission cable (DP, DN)</td>
<td>A signal cable that connects between a slave module and the RJ51AW12AL</td>
</tr>
<tr>
<td>Transmission cycle time</td>
<td>A data sampling interval</td>
</tr>
</tbody>
</table>

**GENERIC TERMS AND ABBREVIATIONS**

Unless otherwise specified, this manual uses the following generic terms and abbreviations.

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>

|                                                | Depth 124mm                                                                |
| Weight                                          | 0.13kg                                                                     |

*1 For slave modules with transmission cables (DP, DN), the length of the transmission cables (DP, DN) is included in the total wiring length.
For wiring of 50m or more with 4 wires (DP, DN, 24V, 0V), insert the noise filter for power supply cables between the power supply and cables. For details, refer to the manual for the AnyWireFILTER (ANF-01) manufactured by Anywire Corporation.

*2 For the relation of the total wiring length, wire diameter of transmission cables (DP, DN), and transmission cable supply current, refer to the following.
On some slave modules with cables, the wire diameter of module-integrated transmission cables (DP, DN) may be smaller than 0.75mr. However, they can be used without any problem, provided that the wire diameter of transmission cables (DP, DN) meets the following requirements.

<table>
<thead>
<tr>
<th>Wire diameter of transmission cables (DP, DN)</th>
<th>Transmission cable supply current</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total wiring length of 50m or less</td>
<td>Total wiring length of 50 to 100m</td>
</tr>
<tr>
<td>1.25mr</td>
<td>2A maximum</td>
</tr>
<tr>
<td>0.75mr</td>
<td>1.2A maximum</td>
</tr>
</tbody>
</table>

*3 When the operating ambient temperature is 50°C or higher, use cables with a temperature rating 75°C or higher.

*4 The performance specification differs depending on the production information of the RJ51AW12AL. (MELSEC iQ-R AnyWireASLINK Master Module User's Manual (Application))
MEMO

2 SPECIFICATIONS
2.1 Performance Specifications
This chapter describes the functions of the RJ51AW12AL. For details on the functions, refer to the following.

AnyWireASLINK Master Module User’s Manual (Application)

### AnyWireASLINK transmission

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bit transmission</td>
<td>Exchanges I/O data of maximum 512 bits (input 256 bits, output 256 bits) between the RJ51AW12AL and a slave module.</td>
</tr>
<tr>
<td>Word transmission(^1)</td>
<td>Exchanges I/O data of maximum 1024 words (input 512 words, output 512 words) between the RJ51AW12AL and a slave module.</td>
</tr>
<tr>
<td>Double verification</td>
<td>A double verification is an error control system. In this system, cycle data in AnyWireASLINK transmission is recognized as valid data if the data matches with the data of the last transmission or is ignored as invalid data if the data does not match with the last data. A double verification ensures reliability of communication.</td>
</tr>
<tr>
<td>Slave module parameter read/write</td>
<td>In AnyWireASLINK, parameter information of a slave module and the AnyWireASLINK system in addition to I/O information are sent and received between the RJ51AW12AL and a slave module. Execute this function to check or change parameter information of a slave module.</td>
</tr>
</tbody>
</table>

\(^1\) The availability of the function differs depending on the production information of the RJ51AW12AL. (AnyWireASLINK Master Module User’s Manual (Application))

### Address setting

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>

<td>Allows for setting start addresses of word data transmission. This function shortens the word transmission cycle time.</td>
</tr>
<tr>
<td>AnyWireASLINK version compatibility inspection function(^1)</td>
<td>Inspects whether a slave module that does not support the word transmission is connected to the RJ51AW12AL or not.</td>
</tr>
</tbody>
</table>

*1 The availability of the function differs depending on the production information of the RJ51AW12AL. ([MELSEC iQ-R AnyWireASLINK Master Module User’s Manual (Application)](#))
This chapter describes the procedures before operation.

1. Configuring a system
Configure an AnyWireASLINK system and set parameters which are required for start-up.
- WIRING (Page 28 WIRING)
- Parameter setting (MELSEC iQ-R AnyWireASLINK Master Module User's Manual (Application))
- Address setting of slave modules (MELSEC iQ-R AnyWireASLINK Master Module User's Manual (Application))
- Automatic address detection function (MELSEC iQ-R AnyWireASLINK Master Module User's Manual (Application))

2. Powering on the system
Power on and start the system in the order shown below.
- Turn on the 24VDC external power supply for the AnyWireASLINK system.
- Turn on the power supply of the programmable controller.

3. Checking operations with the LEDs
Check whether communications are established normally.
When the communications are established normally, the following LED on/off statuses are as follows.
- RUN LED: On
- ERR LED: Off
- LINK LED: Flashing
- SET LED: Off
- ALM LED: Off

4. Programming
Create a program. For details, refer to the following.
Page 34 COMMUNICATION EXAMPLE

- If the programmable controller is powered on before the 24VDC external power supply in the AnyWireASLINK system, a transmission cable voltage drop detection error may occur.
- To power off the system, power off the programmable controller, and turn off the 24VDC external power supply in the AnyWireASLINK system.
5  SYSTEM CONFIGURATION

5.1  System Configuration of AnyWireASLINK

An AnyWireASLINK system consists of the RJ51AW12AL, slave modules, and a terminating unit. The slave modules and a terminating unit are products manufactured by Anywire Corporation.

(1) RJ51AW12AL
(2) Slave module (ASLINKER)
(3) Slave module (ASLINKAMP)
(4) Terminating unit
(5) Cylinder, switch, or others
(6) Sensor head
(7) Link connector

For the number of connectable slave modules, refer to the following.
Page 17 Performance Specifications

For applicable CPU modules and the number of mountable modules, refer to the following.
MELSEC iQ-R Module Configuration Manual
5.2 Power Supply to the AnyWireASLINK System

Method of supplying the power to the slave module

Connect a 24VDC external power supply to the RJ51AW12AL.

The power consumed in the internal control circuits of all the slave modules and the external load power connected to non-isolation slave modules are supplied collectively from the 24VDC external power supply connected to the RJ51AW12AL. (Page 17 Performance Specifications)

Scope of the power supply with transmission cables (DP and DN)

The current consumption of the system must satisfy all the following conditions for the RJ51AW12AL.

<table>
<thead>
<tr>
<th>Item</th>
<th>Calculation formula</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition 1</td>
<td>I(Å) = (Ihin × m) + (Iho × n) + (Izdin × p) + (Izdo × q) ≤ The maximum value of transmission cable supply current</td>
<td>Ihin: Current consumption of the non-isolation input slave module/I/O combined slave module</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Iho: Current consumption of the non-isolation output slave module</td>
</tr>
<tr>

</tr>
<tr>
<td></td>
<td></td>
<td>n: Number of connected non-isolation output slave modules</td>
</tr>
<tr>
<td></td>
<td></td>
<td>p: Number of connected isolation input slave modules/I/O combined slave modules</td>
</tr>
<tr>
<td></td>
<td></td>
<td>q: Number of connected isolation output slave modules</td>
</tr>
<tr>
<td>Condition 2</td>
<td>Vm(V) - ΔV(V) ≥ 20V</td>
<td>Vm: Supply voltage for the RJ51AW12AL</td>
</tr>
<tr>
<td>Condition 3</td>
<td>Vm(V) - ΔV(V) ≥ The lowest allowable voltage of the connected load</td>
<td>ΔV: Cable-to-cable voltage drop</td>
</tr>
</tbody>
</table>

Vm(V): Supply voltage for the RJ51AW12AL
ΔV: Cable-to-cable voltage drop
Description of the condition 1

- **Constants related to the non-isolation slave module (Ihin, Iho)**
  In the non-isolation slave module, the current required for the internal control circuit and the connected load is supplied with transmission cables (DP, DN).
  - **Ihin(A):** Current consumption of the non-isolation input slave module/I/O combined slave module
    - Current consumption of the non-isolation input slave module/I/O combined slave module + Current consumption of connected load (three-wire sensor) \times Number of points
  - **Iho(A):** Current consumption of the non-isolation output slave module
    - Current consumption of the non-isolation output slave module + Current consumption of connected load \times Number of points

- **Point**

  - The 24VL and 0VL terminals of a slave module are used to supply the power to the connected load.
  - For the current consumption of a non-isolation slave module, refer to the manual for the slave module used.
### Constants related to the isolation slave module (Izdin, Izdo)

In the isolation slave module, only the current required for the internal control circuit is supplied with the transmission cables (DP, DN), whereas that for the connected load is supplied from the power cables (24V, 0V).

- **Izdin(A):** Current consumption of the isolation input slave module/I/O combined slave module
- **Izdo(A):** Current consumption of the isolation output slave module

#### Transmission cable supply current (I(A))

The transmission cable supply current in the AnyWireASLINK system is determined by the following formula. (Number of connected modules: m, n, p, q)

\[
I(A) = (I_{hin} \times m) + (I_{ho} \times n) + (I_{zdin} \times p) + (I_{zdo} \times q)
\]

#### Maximum transmission cable supply current

For the maximum transmission cable supply current, refer to the following.

[Page 17 Performance Specifications]
Description of the conditions 2 and 3

- **Vm**: Supply voltage for the RJ51AW12AL
  - Voltage: 21.6 to 27.6VDC (24VDC -10 to +15%), ripple voltage 0.5Vp-p or lower
  - Recommended voltage: 26.4VDC (24VDC +10%)

- **ΔV(V)**: Cable-to-cable voltage drop

<table>
<thead>
<tr>

<th>Calculation formula</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>Condition 1</td>
<td>I(A) = (Ithin × m) = I(A) ≤ The maximum transmission cable supply current</td>
<td></td>
</tr>
<tr>
<td></td>
<td>(0.015 + (0.013 × 2)) × 24 = 0.984A ≤ 1A</td>
<td>Satisfied</td>
</tr>
<tr>
<td>Condition 2</td>
<td>Vm(V) - ΔV(V) ≥ 20V</td>
<td></td>
</tr>
<tr>
<td></td>
<td>24 - (0.984 × 100 × 0.015 × 2) = 24 - 2.95 = 21.05V ≥ 20V</td>
<td>Satisfied</td>
</tr>
<tr>
<td>Condition 3</td>
<td>Vm(V) - ΔV(V) ≥ The lowest allowable voltage of the connected load</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The lowest limit of the allowable voltage range for connected load = 24 - 24 × 0.1 = 21.6V</td>
<td></td>
</tr>
<tr>
<td></td>
<td>21.05V &lt; 21.6V</td>
<td>Not satisfied</td>
</tr>
</tbody>
</table>

The calculation results of the conditions 1) to 3) show that the system cannot be configured.

However, the system can be configured if the power supply for the RJ51AW12AL is changed to 24.55VDC or higher.
This chapter describes the wiring of the RJ51AW12AL.

### 6.1 Terminal Block

#### Type of the terminal block

The following terminal block is used in the RJ51AW12AL.

<table>
<thead>
<tr>
<th>Name</th>
<th>Model</th>
<th>Contact</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transmission cable terminal block</td>
<td>FMC1.5/7-STF-3,81</td>
<td>PHOENIX CONTACT GmbH &amp; Co. KG (<a href="http://www.phoenixcontact.com">www.phoenixcontact.com</a>)</td>
</tr>
</tbody>
</table>

#### Tightening torque

Tighten terminal block screws within the following tightening torque range.

<table>
<thead>
<tr>
<th>Screws tightened</th>
<th>Tightening torque range</th>
</tr>
</thead>
<tbody>
<tr>
<td>Terminal block mounting screw</td>
<td>0.2 to 0.3N·m</td>
</tr>
</tbody>
</table>

To connect the terminal block, a flathead screwdriver having a tipped size of 0.4×2.5mm is required.
Before removing the transmission cable terminal block, check that the terminal block mounting screws on the both sides are completely loosened (removed from the socket).
Pulling with excessive force while the terminal block mounting screws on the both sides are still tightened may damage the devices.
Before tightening, check that there are no short circuits due to the disconnected or frayed wires. Then tighten the terminal block mounting screws on the both sides securely.

#### Signal name of the terminal block

The following shows the signal names of the terminal block.

<table>
<thead>
<tr>
<th>Terminal block</th>
<th>Signal name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IN 24V</td>

<td></td>
</tr>
<tr>
<td>LG</td>
<td>Connected to the neutral point of the noise filter inserted between the 24V and 0V terminals. Ground the LG terminal with the functional ground terminal (FG terminal) on the programmable controller at a single point.</td>
<td></td>
</tr>
</tbody>
</table>
6.2 Wiring Method

This section describes the wiring to the transmission cable terminal block of the RJ51AW12AL.

**Wiring to the transmission cable terminal block**

- **Connecting a cable**
  Insert a cable with a bar solderless terminal into a wire insertion opening and fully push the cable. Then, pull the cable slightly to check that it is clamped securely.

- **Disconnecting a cable**
  Hold down the open/close button of a cable to disconnect with a flathead screwdriver. Pull out the cable with the open/close button held down.
**Precautions**

- In the AnyWireASLINK system, signals and power are supplied to a slave module with two transmission cables: DP and DN. Therefore, use a stranded wire of 1.25\text{mm}^2 or larger as the main line.
- Wires such as general-purpose wires, cabtyre cables, and flat cables can be used.
- Do not run multiple transmission cables (DP, DN) using a multicore cable. Run multiple transmission cables (DP, DN) are affected by noise, causing a malfunction.

![](image)

- The voltage should not fall below the lower limit of the allowable voltage range due to a voltage drop caused by the cable. If the voltage falls below the lower limit, malfunctions may occur.
- Do not connect soldered cables directly to the terminals. Doing so may loosen the screws, resulting in a poor contact.
- Use bar solderless terminals for the wiring to the terminal block. If inserted as is, a stripped cable cannot be clamped properly in a wire insertion opening.
- Use a crimping tool to connect a bar solderless terminal to a cable.
- Before inserting a bar solderless terminal, check the shapes of the wire insertion opening and bar solderless terminal. Then, insert the terminal in the correct orientation. A bar solderless terminal wider than the wire insertion opening may damage the terminal block. (Page 31 Solderless terminal)
- Signal names are not printed on the transmission cable terminal block. To avoid incorrect wiring, wire cables to the terminal block attached to the RJ51AW12AL.
- Do not insert multiple bar solderless terminals into one wire insertion opening. Doing so may cause damage on the terminal block or cable, or malfunction.
## 6.3 Wiring Product

### Applicable wires and cables

Use the following wires or cables connected to the transmission cable terminal block.

<table>
<thead>
<tr>
<th>Classification</th>
<th>Name</th>
<th>Wire diameter</th>
<th>Type</th>
<th>Material</th>
<th>Temperature rating</th>
</tr>
</thead>
<tbody>

<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Solderless terminal

Bare cables can be connected to the transmission cable terminal block; however, for safety reasons, it is recommended to connect bar solderless terminals.

Use UL-listed solderless terminals and, for processing, use a tool recommended by their manufacturer.

6.4 Connecting Slave Module or Terminating Unit

Connection type

- The distance in an AnyWireASLINK stand-alone system is 200m, which is the total wiring length including the main line and branch line. (It varies depending on the wire diameter of the transmission cables (DP, DN) or the transmission cable supply current.)
- AnyWireASLINK systems support tree branch connection, T-branch connection, and multidrop connection.
- Up to 128 slave modules can be connected.

The total wiring length of the transmission distance for the AnyWireASLINK system can be calculated from \( A + B + C \).

Note that the total length should not exceed the total wiring length set for the system to branch lines.
**Terminating unit**

To ensure more stable transmission quality, connect a terminating unit to the end of a transmission cable (DP, DN).

**Terminating unit connection**

Connect at least one terminating unit for one AnyWireASLINK line. Connect it at the farthest end from the RJ51AW12AL. The maximum number of connectable modules differs depending on the terminating unit used. For details, refer to user's manuals for the terminating unit used.

**Branch of transmission cables (DP, DN)**

Connect one terminating unit at the end of a branch line that exceeds 40m.

(1) Main line
(2) 40m or longer branch line
This chapter describes programming and start-up examples of the RJ51AW12AL.

### 7.1 Communication of RJ51AW12AL with Slave Module

The input signals of the input ASLINKER, stored in 'Bit input information area' (Un\G0 to Un\G15) of the RJ51AW12AL, are batch-transferred to the device data of the CPU module. Moreover, the device data of the CPU module is batch-transferred to 'Bit output information area' (Un\G4096 to Un\G4111) of the RJ51AW12AL, and the output signals are transmitted to the output ASLINKER.

#### System configuration example

**System configuration**

The following system configuration is used to describe communication between the RJ51AW12AL and bit slave modules.

- Power supply module: R61P
- CPU module: R04CPU
- AnyWireASLINK master module: RJ51AW12AL (start I/O number: 0000H to 001FH)

**Correlations between devices**

The following shows the correlations between devices.

---

(1) Link connector
(2) Terminating unit
(3) 2-point output ASLINKER
(4) 2-point input ASLINKER
(5) LED
(6) Sensor switch

(1) CPU module
(2) RJ51AW12AL
(3) Input ASLINKER: Address 0
(4) Output ASLINKER: Address 0
(5) Buffer memory
(6) Sensor switch
(7) LED
RJ51AW12AL setting

Connect the engineering tool to the CPU module and set parameters.

1. Set the CPU module as follows.
   - [Project] ⇒ [New]

2. Click the [OK] button to add the module labels of the CPU module.

3. Set the RJ51AW12AL as follows.
   - [Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ Right-click ⇒ [Add New Module]
4. Click the [OK] button to add the module labels of the RJ51AW12AL.

5. Set the items in "Basic setting" as follows.

   ![Diagram of MELSOFT QX Works]

   - [Navigation window] ⇒ [Parameter] ⇒ [Module Information] ⇒ [RJ51AW12AL] ⇒ [Module Parameter] ⇒ [Basic Settings]

6. Write the set parameters into the CPU module, and reset the CPU module or power off and on the system.

   ![Point]

   In this example, default values were used for parameters that are not shown above. For the parameters, refer to the following.

   MELSEC iQ-R AnyWireASLINK Master Module User's Manual (Application)
**Settings of the slave module**

Write addresses to slave modules to register the RJ51AW12AL.

**Address setting**

Write addresses to slave modules with an address writer.

- Output ASLINKER: Address 0 (ID: 0000H)
- Input ASLINKER: Address 0 (ID: 0200H)

**Automatic address detection**

Keep pressing the SET switch on the RJ51AW12AL until the SET LED turns on.

When the SET LED flashes and then turns off, it indicates that the registration of IDs (addresses) has been completed.

**Checking the system status**

Check whether the RJ51AW12AL can communicate with the slave modules normally.

The following LED statuses indicate that the communication is established normally.

- LED of the RJ51AW12AL

<table>
<thead>
<tr>
<th>LED</th>
<th>Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>RUN LED</td>
<td>On</td>
</tr>
<tr>
<td>ERR LED</td>
<td>Off</td>
</tr>
<tr>
<td>LINK LED</td>
<td>Flashing</td>
</tr>
<tr>
<td>SET LED</td>
<td>Off</td>
</tr>
<tr>
<td>ALM LED</td>
<td>Off</td>
</tr>
</tbody>
</table>

- LED of the ASLINKER

<table>
<thead>
<tr>

**Program example**

### Classification

<table>
<thead>
<tr>
<th>Classification</th>
<th>Label name</th>
<th>Description</th>
<th>Device</th>
</tr>
</thead>
<tbody>
<tr>
<td>Module label</td>
<td>RJ51AW12AL_1.bModuleREADY</td>
<td>Module READY</td>
<td>X0</td>
</tr>
<tr>
<td></td>
<td>RJ51AW12AL_1.bDP_DNShortError</td>
<td>DP/DN short error</td>
<td>X1</td>
</tr>
<tr>
<td></td>
<td>RJ51AW12AL_1.b24V_DPSHORTError</td>
<td>24V/DP short error</td>
<td>X2</td>
</tr>
<tr>
<td></td>
<td>RJ51AW12AL_1.bTransmissionCableVoltageDropError</td>
<td>Transmission cable voltage drop error</td>
<td>X3</td>
</tr>
<tr>
<td></td>
<td>RJ51AW12AL_1.bDP_DNDisconnectionError</td>
<td>DP/DN disconnection error</td>
<td>X4</td>
</tr>
<tr>
<td></td>
<td>RJ51AW12AL_1.uInputInformationArea0_15</td>
<td>Bit input information area</td>

</tr>
<tr>
<td></td>
<td>RJ51AW12AL_1.uOutputInformationArea0_15</td>
<td>Bit output information area</td>
<td>U0/G4096</td>
</tr>
</tbody>
</table>

### Label to be defined

Define the global label as follows.

<table>
<thead>
<tr>
<th>Label Name</th>
<th>Data Type</th>
<th>Class</th>
<th>Assign (Device/Label)</th>
</tr>
</thead>
<tbody>
<tr>
<td>TimerContact</td>
<td>Timer</td>
<td>VAR_Global</td>
<td>T0</td>
</tr>
<tr>
<td>ProgramStart</td>
<td></td>
<td>VAR_Global</td>
<td>K4X100</td>
</tr>
<tr>
<td>InputArea</td>
<td>Word [Signed]</td>
<td>VAR_Global</td>
<td>K4Y100</td>
</tr>
<tr>
<td>OutputArea</td>
<td>Word [Signed]</td>
<td>VAR_Global</td>
<td>K4Y100</td>
</tr>
</tbody>
</table>

(0) When 'Module READY' (X0) turns on, wait at least one second and start the program.

(1) If 'Module READY' (X0) is turned on, the values of 'Bit input information area' (U0/G0) are transferred to 'Input ASLINKER data storage area' (K4X100).

(2) The values of 'Output ASLINKER data storage area' (K4Y100) are transferred to 'Bit output information area' (U0/G4096).

### Point

After 'Module READY' (X0) turns on, wait at least one second and start the program.
7 COMMUNICATION EXAMPLE

Japanese manual number: SH-081582-C

This manual confers no industrial property rights or any rights of any other kind, nor does it confer any patent licenses. Mitsubishi Electric Corporation cannot be held responsible for any problems involving industrial property rights which may occur as a result of using the contents noted in this manual.

© 2016 MITSUBISHI ELECTRIC CORPORATION
WARRANTY

Please confirm the following product warranty details before using this product.

1. Gratis Warranty Term and Gratis Warranty Range
   If any faults or defects (hereinafter "Failure") found to be the responsibility of Mitsubishi occurs during use of the product within the gratis warranty term, the product shall be repaired at no cost via the sales representative or Mitsubishi Service Company.

   However, if repairs are required onsite at domestic or overseas location, expenses to send an engineer will be solely at the customer's discretion. Mitsubishi shall not be held responsible for any re-commissioning, maintenance, or testing on-site that involves replacement of the failed module.

   [Gratis Warranty Term]
   The gratis warranty term of the product shall be for one year after the date of purchase or delivery to a designated place. Note that after manufacture and shipment from Mitsubishi, the maximum distribution period shall be six (6) months, and the longest gratis warranty term after manufacturing shall be eighteen (18) months. The gratis warranty term of repair parts shall not exceed the gratis warranty term before repairs.

   [Gratis Warranty Range]
   (1) The range shall be limited to normal use within the usage state, usage methods and usage environment, etc., which follow the conditions and precautions, etc., given in the instruction manual, user's manual and caution labels on the product.

   (2) Even within the gratis warranty term, repairs shall be charged for in the following cases.
      1. Failure occurring from inappropriate storage or handling, carelessness or negligence by the user. Failure caused by the user's hardware or software design.
      2. Failure caused by unapproved modifications, etc., to the product by the user.
      3. When the Mitsubishi product is assembled into a user's device, Failure that could have been avoided if functions or structures, judged as necessary in the legal safety measures the user's device is subject to or as necessary by industry standards, had been provided.
      4. Failure that could have been avoided if consumable parts (battery, backlight, fuse, etc.) designated in the instruction manual had been correctly serviced or replaced.
      5. Failure caused by external irresistible forces such as fires or abnormal voltages, and Failure caused by force majeure such as earthquakes, lightning, wind and water damage.
      6. Failure caused by reasons unpredictable by scientific technology standards at time of shipment from Mitsubishi.
      7. Any other failure found not to be the responsibility of Mitsubishi or that admitted not to be so by the user.

2. Onerous repair term after discontinuation of production
   (1) Mitsubishi shall accept onerous product repairs for one year after production of the product is discontinued. Discontinuation of production shall be notified with Mitsubishi Technical Bulletins, etc.

   (2) Product supply (including repair parts) is not available after production is discontinued.

3. Overseas service
   Overseas, repairs shall be accepted by Mitsubishi's local overseas FA Center. Note that the repair conditions at each FA Center may differ.

4. Exclusion of loss in opportunity and secondary loss from warranty liability
   Regardless of the gratis warranty term, Mitsubishi shall not be liable for compensation to:
   (1) Damages caused by any cause found not to be the responsibility of Mitsubishi.
   (2) Loss in opportunity, lost profits incurred to the user by Failures of Mitsubishi products.
   (3) Special damages and secondary damages whether foreseeable or not, compensation for accidents, and compensation for damages to products other than Mitsubishi products.
   (4) Replacement by the user, maintenance of on-site equipment, start-up test run and other tasks.

5. Changes in product specifications
   The specifications given in the catalogs, manuals or technical documents are subject to change without prior notice.
